

With BI HomeGuard™ 200, Home Confinement Monitoring Means a Safer Community

Today, approximately seven out of ten offenders are not behind bars, but reside within our neighborhoods. Criminal justice professionals have an increasing need for reliable and effective sanctions for offenders released into the community. In response to this need, BI HomeGuard™ 200 was developed and is currently the most advanced radio frequency monitoring system available.

HomeGuard delivers a state-of-the-art radio frequency monitoring system that meets agency requirements for flexibility, reliability, and efficiency. Pairing traditional electronic monitoring components and unique service options, HomeGuard can be easily integrated with a variety of monitoring products, or can be used alone as an effective curfew compliance system.

Agencies worldwide depend on BI Incorporated to provide effective supervision tools for monitoring community-based offenders. BI was the pioneer in traditional electronic monitoring and is the leader with more than 18 years of experience in the community corrections market. By listening and responding to the needs of our customers, BI is able to provide solutions to the real problems faced by criminal justice professionals.

Advanced Technology

HomeGuard uses the standard components of a traditional electronic monitoring system — a transmitter worn by the offender and a receiver that is connected to the phone line in the offender's home. Using radio frequency technology, the receiver monitors the presence or absence of an offender within a specified range. This information is then compared to the agency's defined schedule restrictions to determine the offender's compliance.

Compliance and system status information are monitored by the BI GuardCenter™ or by a host system at the agency's site. HomeGuard's system status information provides feedback on low battery levels in the transmitter or receiver, tamper detection, power and telephone failures, and other equipment operation conditions.

The proven benefits of BI's traditional radio frequency monitoring products have been strengthened with innovative technology, giving HomeGuard a comprehensive set of features unmatched in the industry.

HomeGuard uses a transmitter worn by the offender and a receiver that is connected to the phone line in the offender's home.

The standard transmitter is appropriate for installation on the ankle and offers a 12-month battery for extended sentences.

BI can assist agencies by providing monitoring services through BI's ISO 9001 certified GuardCenter.

Flexible and Always Reliable

To aid agencies in monitoring offenders requiring different levels of supervision, BI designed HomeGuard with the flexibility to meet any curfew monitoring requirement. The HomeGuard receiver incorporates features to facilitate a fast installation. Agency configurable options match the system's monitoring capabilities to the risk assessment of the offender. In addition to variable range settings, HomeGuard also offers a variable leave window, and unlimited schedules.

The standard transmitter is appropriate for installation on the ankle and offers a 12-month battery for extended sentences. Transmitters use field replaceable batteries and the transmitter installation requires no tools, so it's quick and easy.

BI knows that offender monitoring is an important responsibility, so we designed HomeGuard to provide unparalleled reliability. HomeGuard's 48-hour receiver battery, 4,800 message buffer and nonvolatile memory provide a high level of security to ensure that monitoring services won't be disrupted due to power or phone failures. Plus, reliable dual tamper detection keeps agencies informed when there is deliberate equipment interference. With HomeGuard, agencies have a radio frequency monitoring system that they can depend on to effectively and efficiently manage offender compliance to community-based sanctions.

Industry Leading Integration and Monitoring

Many providers offer radio frequency monitoring systems, but no other system on the market compares with HomeGuard. BI combines knowledge and experience to provide an easy-to-use product with increased reliability, greater flexibility, and system integration capability. Because varying levels of supervision are required, BI compliance monitoring products and services can be integrated to provide a continuum of graduated sanctions matched specifically to each offender's profile. HomeGuard operates in conjunction with several other BI monitoring products, including Sobrietor™ remote alcohol testing and BI VoiceID™ voice verification.

BI can assist agencies by providing the monitoring service for single or integrated BI compliance monitoring products. HomeGuard monitoring is performed by BI's GuardCenter, an ISO 9001 certified monitoring service center. Trained BI personnel monitor and report the communication between the HomeGuard system and the GuardCenter host system in accordance with agency-specified procedures. An agency may also utilize an on-site host system allowing them to control compliance monitoring internally. BI works closely with every customer to determine which monitoring system best meets their needs.

With increasing numbers of offenders residing in our communities, criminal justice agencies need a dependable monitoring system to help effectively supervise these offenders. HomeGuard combines advanced technology and superior reliability to provide agencies with the most comprehensive curfew-based compliance monitoring tool available on the market today, and when integrated with BI treatment programs, delivers one of the most effective community-based sanctions available.
